Details

Overview

You will be working on an application of your choice and design. Students are allowed to work on any project as long as the following constraints are met:

1. Your project must be full-stack and use AWS EC2 on the backend.
2. Due to University rules, you can't do anything that requires you to operate in a legal gray zone. For example, using [Nintendo ROMs](https://www.polygon.com/2019/9/11/20860039/nintendo-copyright-trademark-infringement-rom-lawsuit) to build an emulator or building a website that hosts them.
3. **NO adult-oriented apps** (I can't believe I have to mention this, but it has happened). This includes cartoons! Other students will review your app, and we need to be respectful; your opinion on what is or isn't adult doesn't matter. (PG rated!!)
4. This is the **initial** draft that you must submit for approval.

Minimum Project requirements

Below is a breakdown of the minimum requirements that your application must meet.

- Have a landing page with navigation to all your other pages
- Each page should have a shared header and footer with navigation and appropriate information
- Have at least one form somewhere that allows you to submit data from AWS
- Have a method to retrieve database entries and display them on the page
- Have a way to delete data
- You must have a way to retrieve data and display it on a separate page conditionally. You can do this any way you wish, but you can not just return the entire database.
- Have at least four different pages (Single-page apps are an exception)
- All your pages must be styled with raw CSS or a framework like [Bootstrap](https://getbootstrap.com/)
- Scripts to set up a new EC2 instance and install all required packages

Project Ideas

Can't think of anything to build? Here are some ideas:

- The [Google graveyard](https://killedbygoogle.com/) has (at the time of this writing) 296 killed projects. Keep in mind that Google thinks in billions: billions of users, billions of dollars, and billions of servers! So a lot of these projects were killed not because they were bad ideas or not successful, but they were just not in the billions.
- Write a Discord bot with a website frontend that does something interesting, like give interesting facts about nocturnal giant Russian mountain gophers.
- Write a web game. For example, you can write a simple Asteroids clone or slither.io
- You can use previous labs as a starting point!!!!!! HINT HINT :)
- Write a TODO app
- Write a grocery list app (add, remove, check off, etc.)
- You can ChaptGPT to help you generate ideas as well.

Task 1: Project Specification

For this task, all you have to do is create a Google Doc to describe what you intend to build. Your Doc should include enough detail for me to have a good idea of the project's scope and length. Your write-up should be at least 900 words. At a minimum, you should detail the following:

- If you are using your own tech stack, you need to give the details below. Make sure to specify the following:

- Backend Language
- Backend Framework
- Database
- Frontend Templates
- Frontend Styling
- A Script to Install packages on EC2
- A Script to Configure your app on EC2
- Detailed instructions for how to install, configure, and run your app.
- How are you going to do automated testing

Required Sections

- Overview
 - What is the general theme? For example, a photo gallery, recipe repository, Twitter clone, e-commerce inventory, API-driven data mining, a generic wedding, a message board for the class, dentistry, etc.
 - If you are cloning an existing site, make sure to give links to that site.
- Target audience
 - Who is the target audience? For example: The general public, family members, research scientists, students, etc. How is your app useful, and what niche does it serve?
- Functionality
 - What is it going to do? For example, draw customers to a photography business by showing a portfolio, pricing, contact information, and booking. Mine data from IMDB to answer questions about movies and movie stars. Forum to facilitate communication between users. Etc.
- Database Schema
 - What sort of data will it manage? Schedule out a high-level schema for your database. Don't worry, you can change it later. This is just to get you started.
- Media
 - What media will you need or create? Where are you going to get your images? AI-generated, stock photos, etc.
- Wire Frames
 - You will need to create [wireframes](https://en.wikipedia.org/wiki/Website_wireframe) of each of your planned pages. You can use any tool to create the wireframes. You need to explore the different tools available and detail how you are going to create your wireframes for your application. You can use a tool such as [Moqups](https://moqups.com/) or [Figma](https://www.figma.com/wireframe-tool/) to create your wireframes, or just draw them and scan them into your document. You don't have to pay for a tool; free tools work fine.
- Schedule
 - There will be seven project checkpoints in the last 8 weeks of class. Detail out a rough schedule of what you will have accomplished at each checkpoint. The checkpoints need to give concrete deliverables that can be assessed. NOTE: The checkpoints in the example below are specific to the example. Your project **should** have a customized set of checkpoints, do not just blindly copy and paste from the example.

Submitting

Submit your Google Doc so I can approve your project.

- [Instructions](https://community.instructure.com/en/kb/articles/661222-how-do-i-upload-a-file-from-google-drive-as-an-assignment-submission-in-canvas) for submitting a Google Doc.
- Use the Rubric below for grading requirements.
- I have created an [example submission](https://docs.google.com/document/d/1BgRDpN-Sb2VEHJd7exkbD9Rj03am40exdvPaA_KZxds/edit?usp=sharing) for you to reference.
 - **NOTE:** IF you submit the example back to me as your project, you will receive a fail. You must come up with your own example.
